What is Hinton and Li's perspective of the risk of AI development? Quote a couple of sentences from the video to support your conclusion.

Hinton and Li both think AI has lots of benefits, but at the same time, it will bring us some risks. The risks they worry about are different in some ways.

Hinton is more concerned about the long-term risks of AI. He thinks future AI will be much smarter than humans and may even develop and improve itself. If AI becomes more intelligent than humans and wants more control over itself, then humans may not have the power to stop it at that time. In this video, he mentioned that the highest risk of AI is, “The existential risk is that humanity gets wiped out because we've developed a better form of intelligence that decides to take control.”

Li also talks about the risks of AI, but she focuses more on the existing or upcoming problems and issues, such as unemployment, fake news, weaponized AI, bias, privacy, and the power imbalance between companies or departments that use AI. She thinks these issues are more realistic than AI killing all humans in the future. This is what she said in the video: “The catastrophic risk bucket, I think it's much more real.”

Overall, Hinton is more worried about losing control of AI, while Li is more focused on the real impact of AI on society. However, they both think AI should be developed responsibly. We cannot pursue AI's abilities and forget about safety and its effects on society.

What is your stand on the risk of AI development and why?

I think AI development does show some risks and problems now, but I don’t think it is a reason to stop developing and improving AI. In this video, I agree more with Li’s points because we have already seen a lot of fake news, fake videos, and unemployment happening right now. Although I agree with Li, Hinton’s concerns cannot be ignored either since we do not know how fast AI will develop.

In the end, AI brings more benefits than downsides now, such as medical research, scientific research, etc. So I think the best way is to keep improving AI, while the government and researchers make rules to regulate it and make sure people use it responsibly.
